

Roebling Labs LLC

We build vessel collision warning systems for vulnerable bridges.

Roebling Labs assigns threat levels to AIS-equipped vessels by combining real-time transponder tracking, trajectory forecasting, and AASHTO impact analysis.

Problem

NTSB Recommendation [H-25-030](#) to “incorporate motorist warning systems capable of activating when a threat is identified and stop motorists from entering the bridge.”

Solution

Roebling Labs’ system provides real-time risk information on AIS-equipped vessels. Bridge operations staff evaluate and respond to alerts as appropriate to communicate with vessels and close and open traffic gates.

We assess AIS-equipped vessels based on the probability of aberrancy and consequence of collision.

Figure 1 - See Dashboard at vesselcollision.com

Consequence of Collision		Probability of Aberrancy			
		Low	Medium	High	Critical
Consequence of Collision	High	LOW	CAUTION Aberrant vessel detected	ALARM High vessel collision risk	ALARM Collision detected
	Medium	LOW	CAUTION Aberrant vessel detected	ALARM High vessel collision risk	ALARM Collision detected
	Low	LOW	LOW	CAUTION Aberrant vessel detected	CAUTION Collision detected
